Filter count data where you have 0 read count across all samples.

```
countData = countData[-which(rowSums(countData)==0), ]

Quick Plot
plot(pca$x[,1:2])
```

```
plot(pca$x[, 1:2], pchh=18, col=as.factor(colData$condition))
text(pca$x[, 1:2], labels =colData$condition, pos = 4)
```

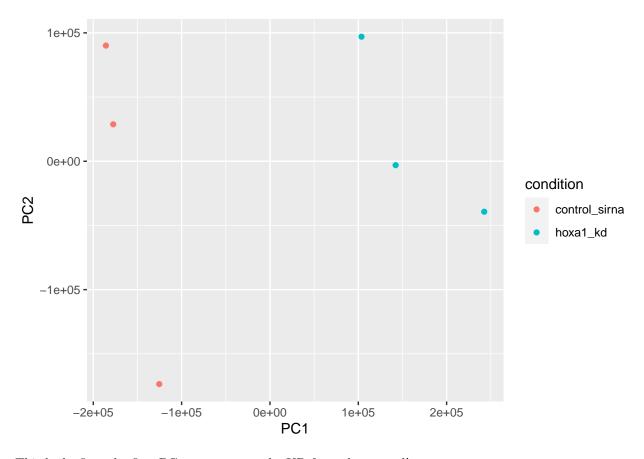

#### Or a ggplot version

```
library(ggplot2)

x <- as.data.frame(pca$x)
x$condition <- colData$condition

ggplot(x)+
  aes(PC1, PC2, col=condition)+
  geom_point()</pre>
```

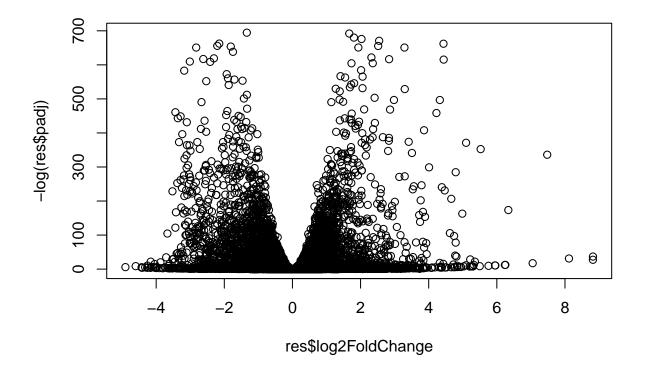

This looks fine- the first PC separates out the KD from the control!

## Reactome Analysis

First, Using R, output the list of significant genes at the 0.05 level as a plain text file:

```
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))</pre>
```

```
## [1] "Total number of significant genes: 8147"
```

write.table(sig\_genes, file="significant\_genes.txt", row.names=FALSE, col.names=FALSE, quote=FALSE)

Then, to perform pathway analysis online go to the Reactome website (https://reactome.org/PathwayBrowser/#TOOL=AT). Select "choose file" to upload your significant gene list. Then, select the parameters "Project to Humans", then click "Analyze".
